HAZARDSCRC

MEASURING THE IMPACTS OF NATURAL HAZARDS ON HUMAN FATALITIES AND BUILDING LOSSES

Rob van den Honert, Katharine Haynes, Lucinda Coates
Risk Frontiers, Macquarie University, NSW

An Australian Government Initiative

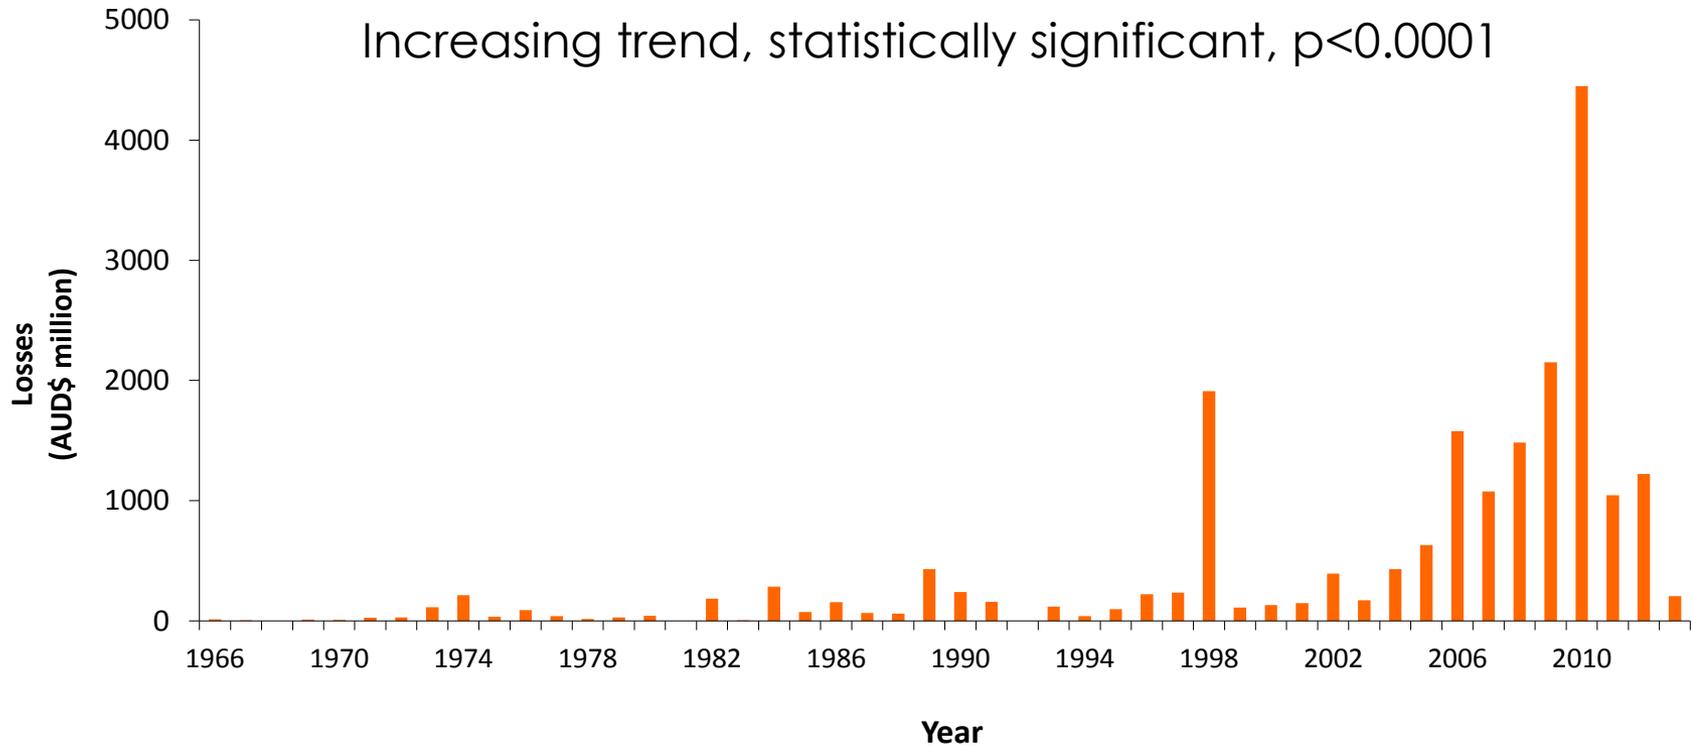

Objectives of the CRC project

To measure and understand the impacts of natural hazards in terms of

- the toll on human life and injuries, and
- building losses and damage

in order to provide an evidence base for emergency management policy and practise.

Australian weather-related natural disaster losses

(Crompton et al. 2010)

Australia – coastal developments

Gold Coast Main Beach

Gold Coast - Tweed Heads

Cost per dwelling

Number of dwellings

Normalisation of natural disaster loss data

- *Normalisation* refers to the process of adjusting historical losses for known societal changes (e.g. numbers of homes, the value of these homes, and improvements in building codes and construction).
- Normalised losses effectively estimate the losses as if *past events* were to impact *present-day society* (i.e. an ‘apples-versus apples’ comparison of event losses over time).

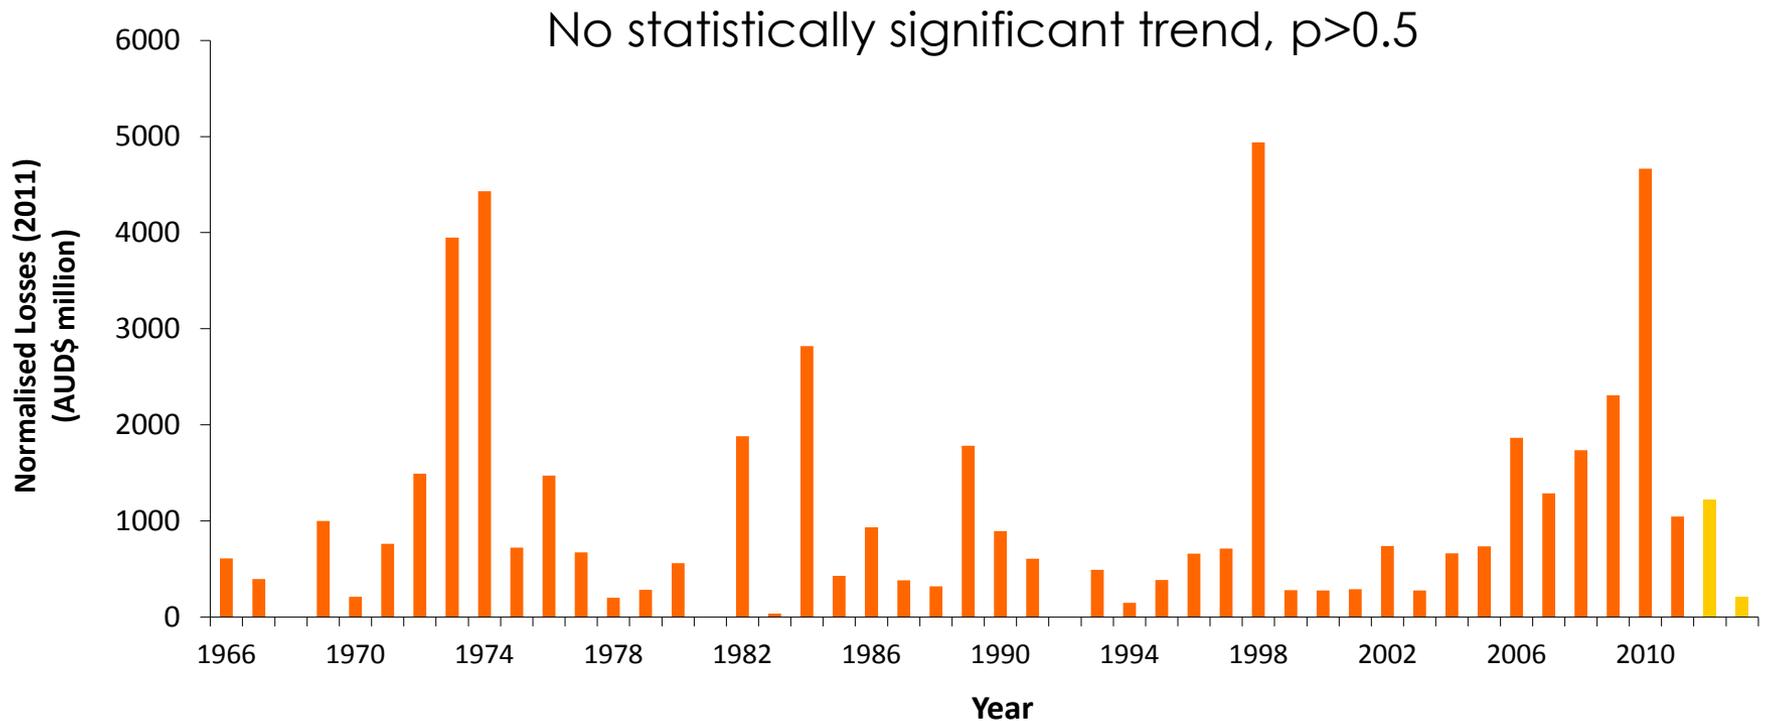

Major Australian Disaster Losses (normalised)

What perils have caused the greatest losses?

| Event | Ranking | Year | Normalised cost |
|-------------------------|---------|------|------------------|
| Sydney Hailstorm | 1 | 1999 | 4.3 Billion AU\$ |
| Tropical Cyclone Tracy | 2 | 1974 | 4.1 Billion AU\$ |
| Newcastle Earthquake | 3 | 1989 | 3.2 Billion AU\$ |
| QLD Floods | 5 | 2011 | 2.5 Billion AU\$ |
| Ash Wednesday Bushfires | 7 | 1983 | 1.8 Billion AU\$ |

Normalised insured losses as if all events were to impact upon 2011 societal and demographic conditions
(Source: ICA/Risk Frontiers)

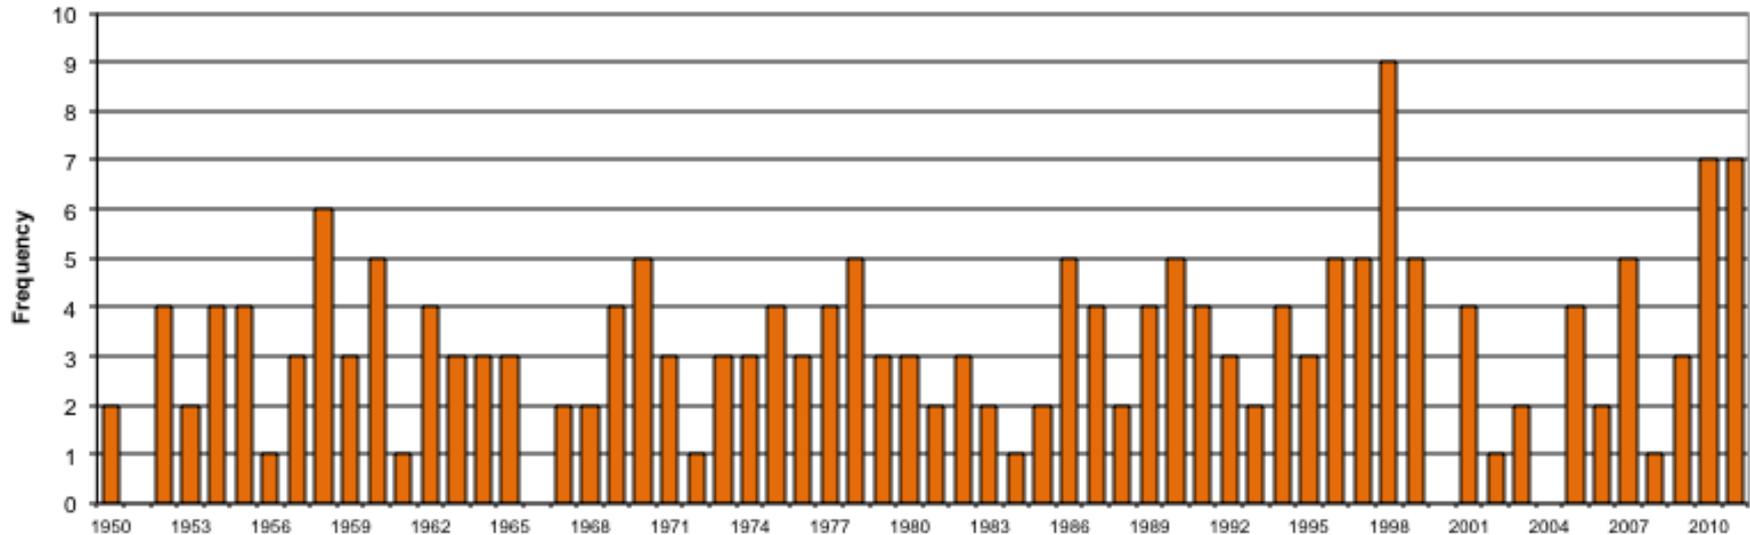

Normalised Australian weather-related natural disaster losses

(Crompton et al. 2010)

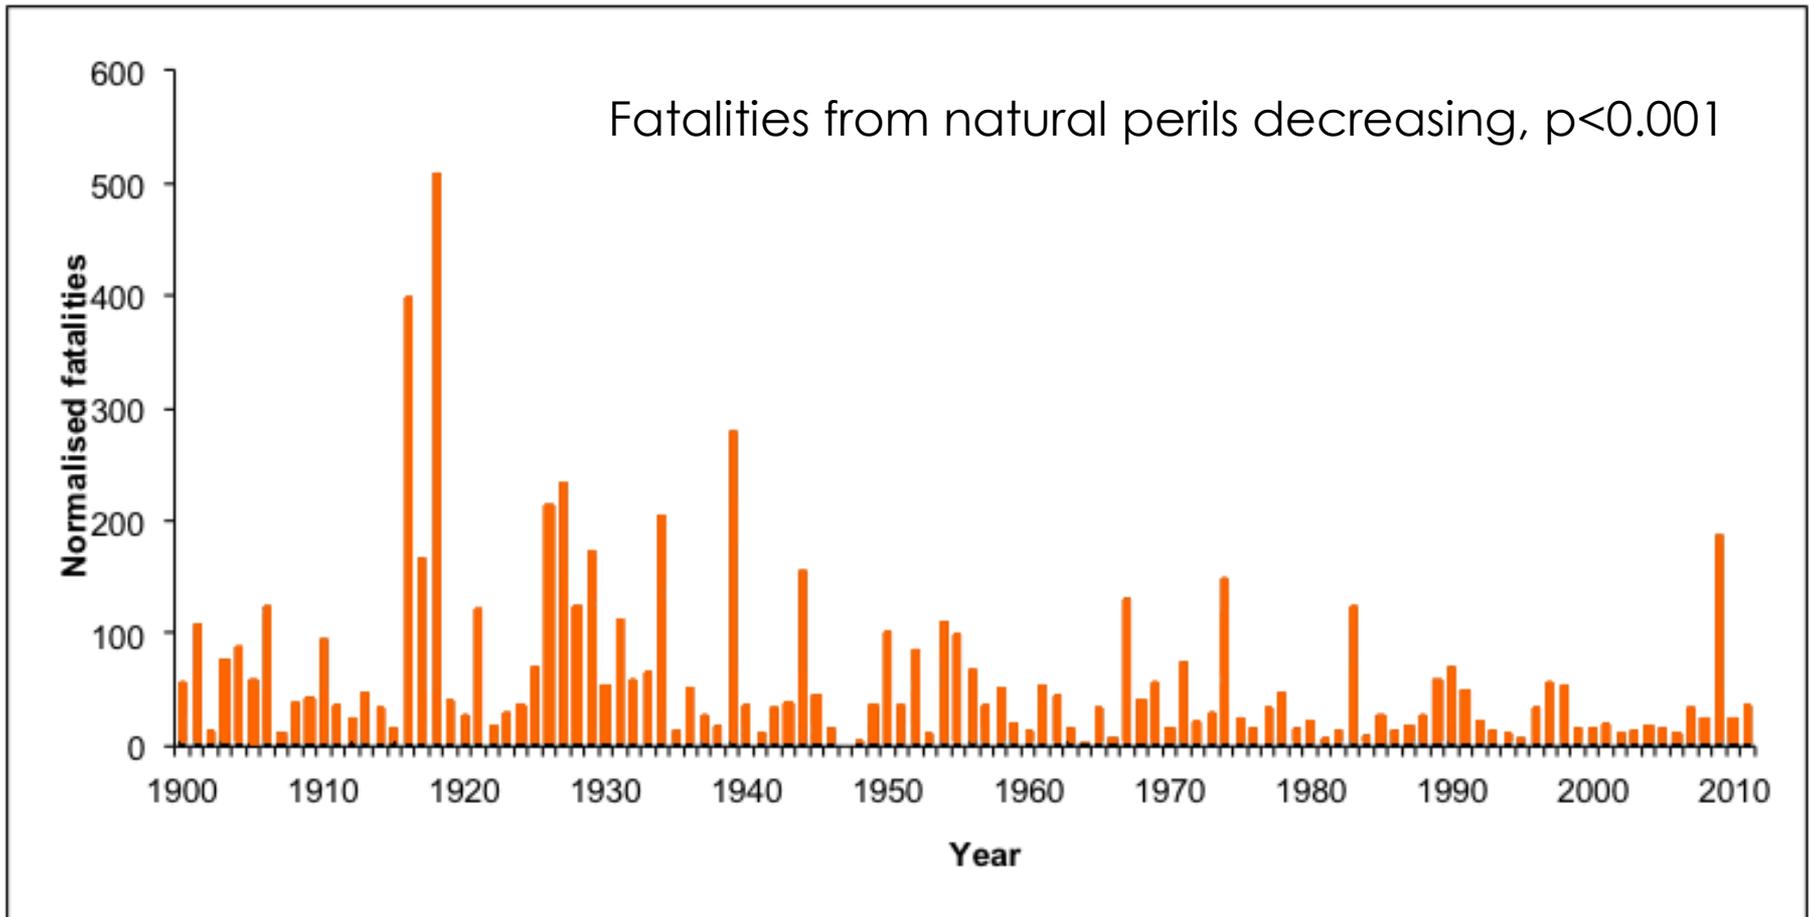

Australian bushfire frequency

Frequency of events with normalised HE>50, by year

- Normalised losses > 50 HE, i.e. fairly large fires only
- Slope is *not* statistically significant

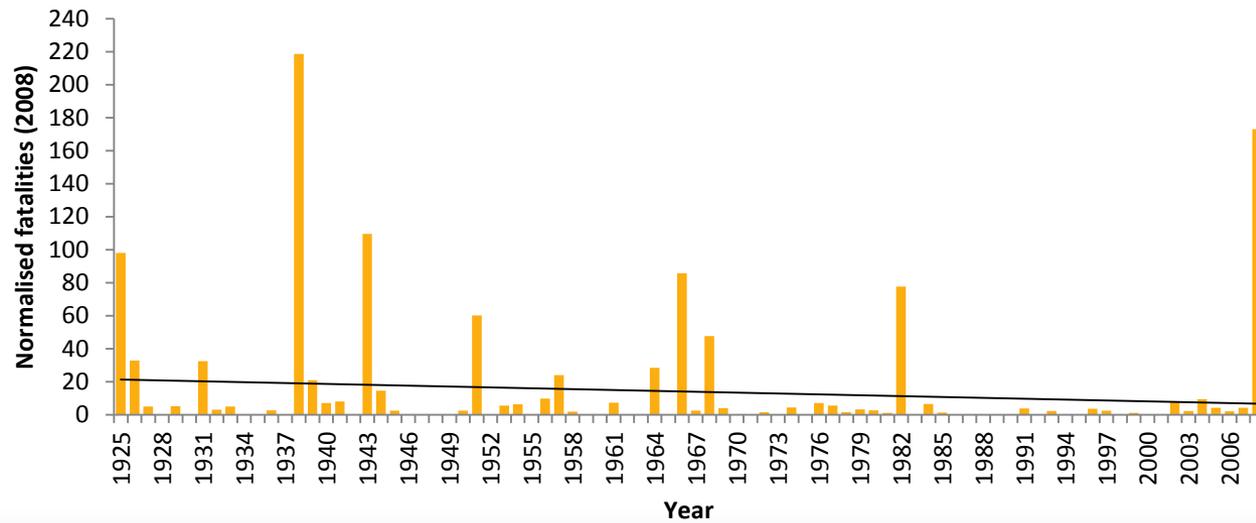

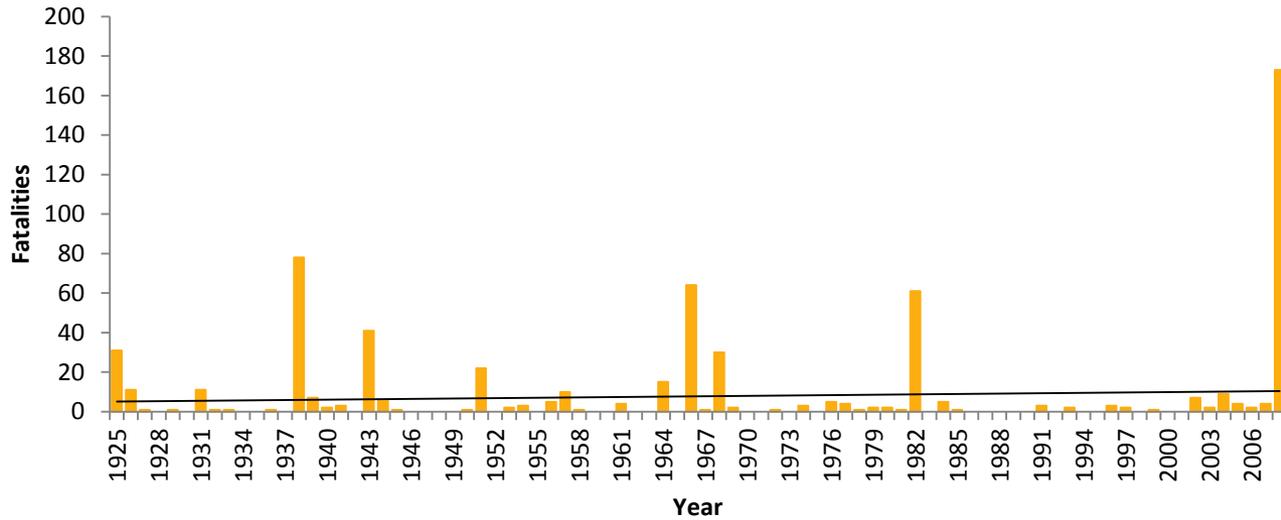

Fatalities from natural perils *normalised* by population

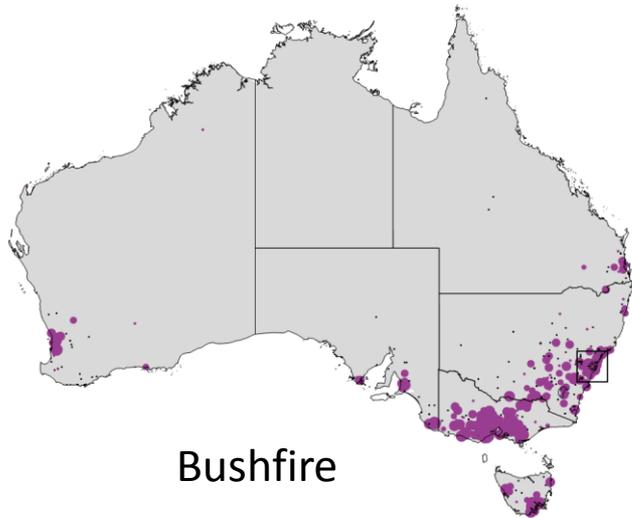

Perils include:

bushfire, earthquake, flood, grassfire, wind gust, hail, landslide, lightning, rain, tornado and tropical cyclone

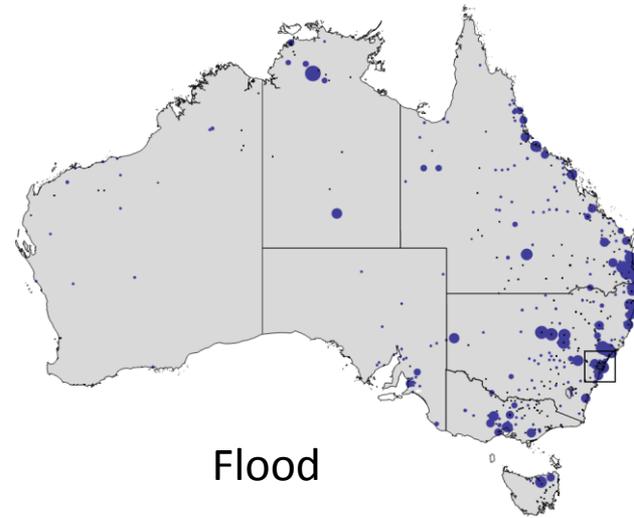

Bushfire fatalities

Bushfire

Flood

Tropical Cyclone

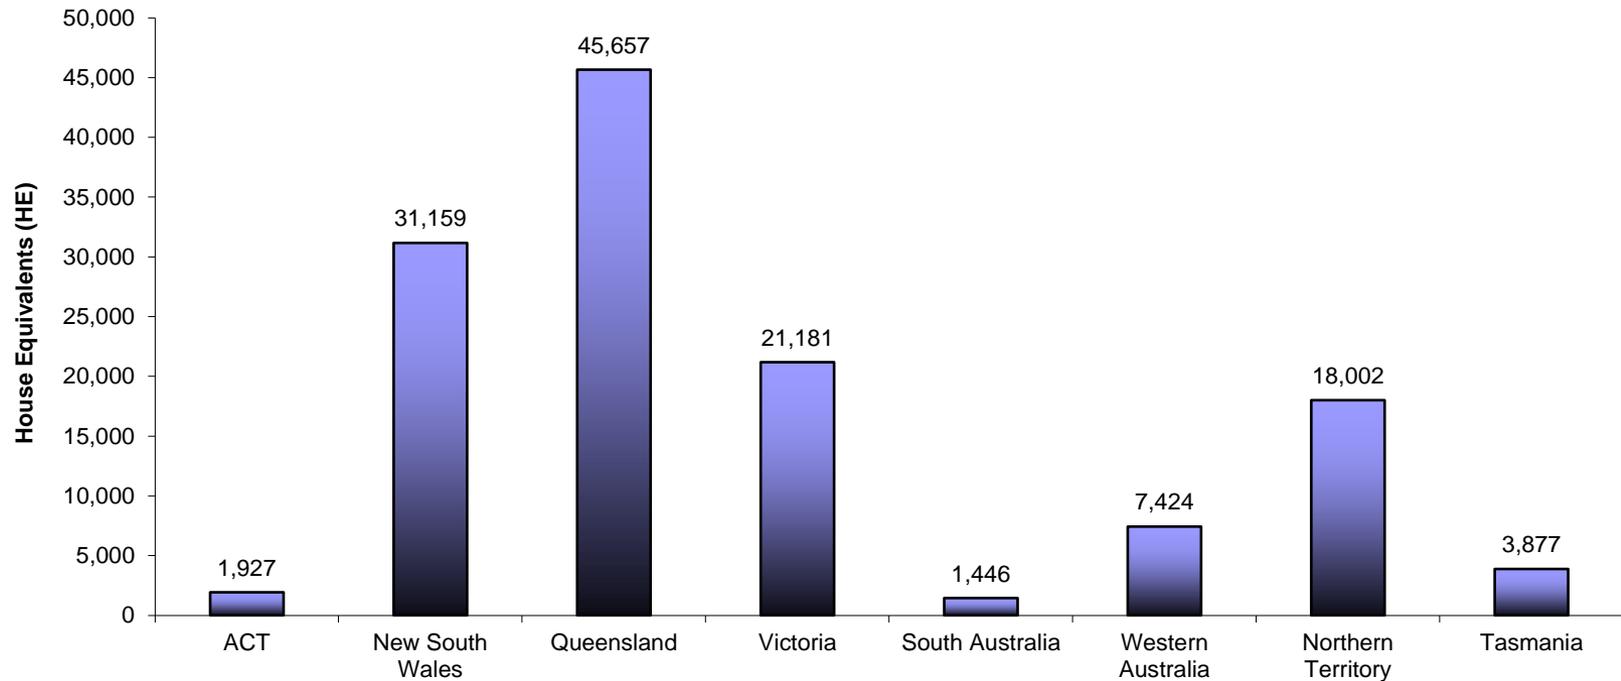

Hail

Historical event losses since 1926. Source: Risk Frontiers' *PerilAUS* database

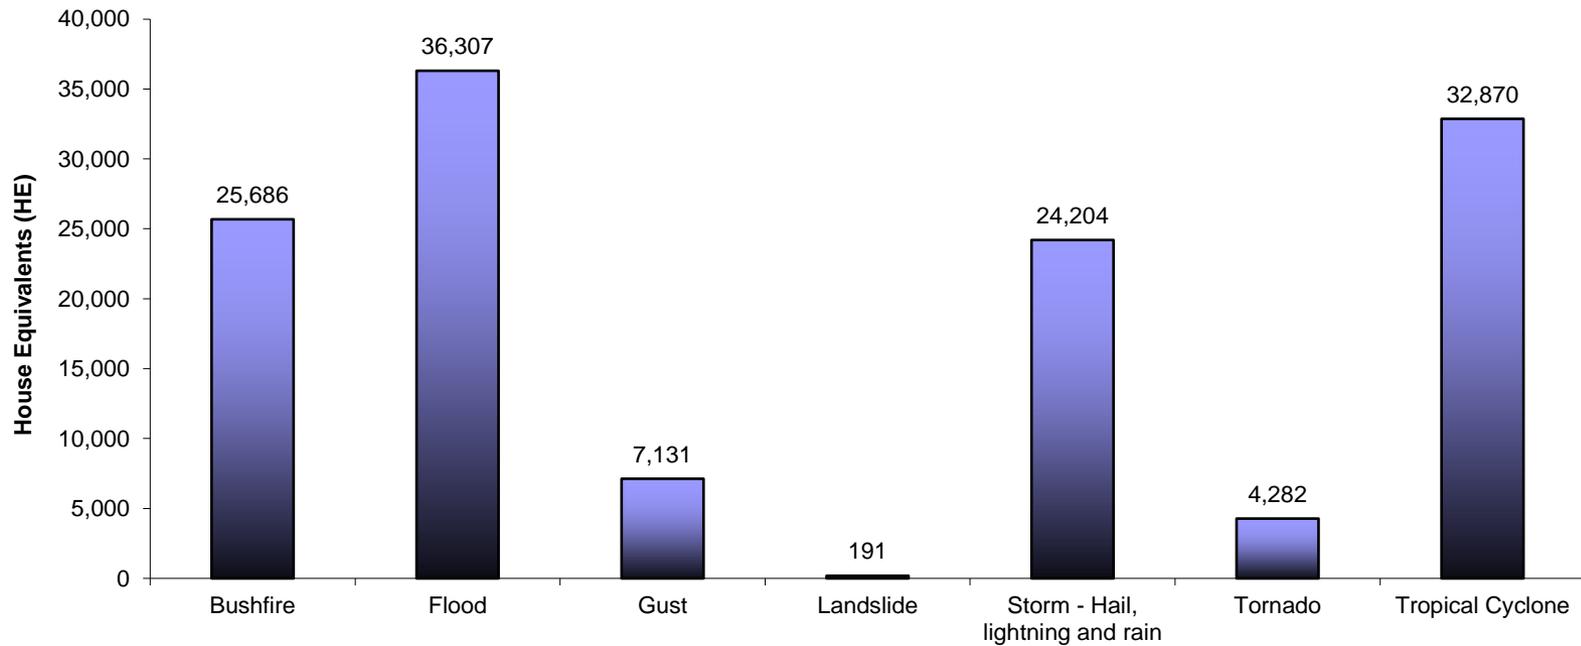

PerilAUS: A History of Natural Disasters

Natural hazard losses in Australia
Total HE losses by state, 1925/26-2010/11

PerilAUS: A History of Natural Disasters

Natural hazard losses in Australia
Total HE losses by hazard type, 1925/6 to 2010/11

Natural hazard fatalities

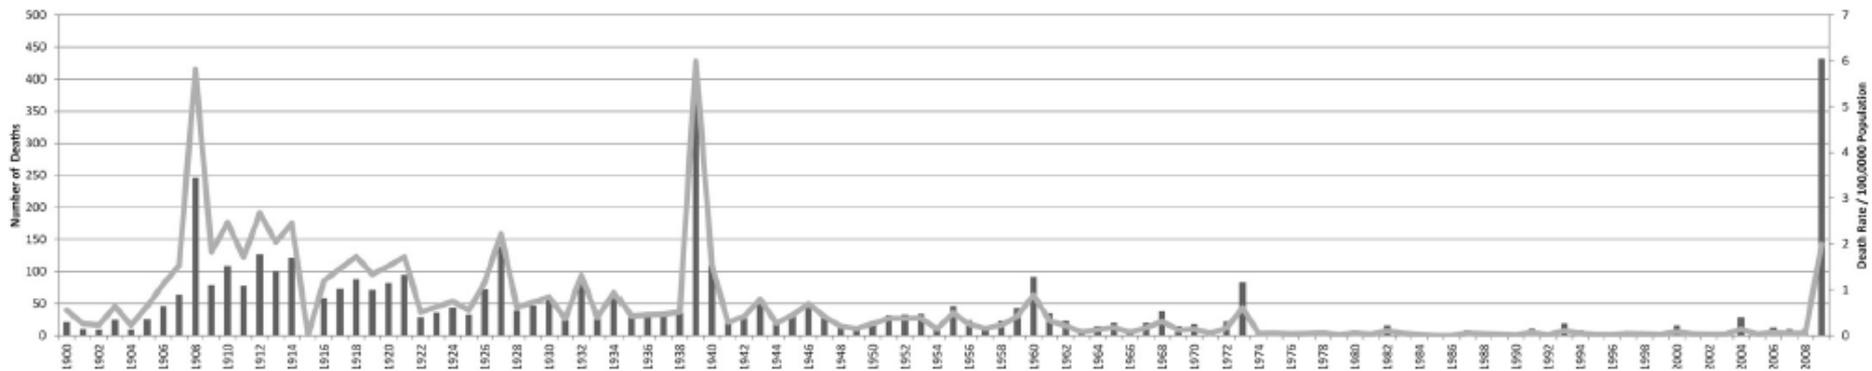

| Natural hazard | Deaths 1900–2011 | % total natural hazard deaths 1900–2011 |
|------------------|---------------------|---|
| Extreme heat | 4,555 | 55.2 |
| Flood | 1,221 | 14.8 |
| Tropical cyclone | 1,285 | 15.6 |
| Bush/grassfire | 866 | 10.5 |
| Lightning | 85 | 1 |
| Landslide | 88 | 1.1 |
| Wind storm | 68 | 0.8 |
| Tornado | 42 | 0.5 |
| Hail storm | 16 | 0.2 |
| Earthquake | 16 | 0.2 |
| Rain storm | 14 | 0.2 |

(Coates et al. 2014)

Heatwave fatalities, 1900-present

Analysis of heat-related deaths shows that

- Number of deaths (and death rate) have decreased steadily since 1900
- Fatalities have been virtually zero since the mid-1970s

(Coates et al. 2014)

Project activities and aims

- Collect further data to complete the record of natural disasters in Australia (*PerilAUS*) –
 - Descriptions
 - Losses/damage
 - Fatalities (coronial records)
 - Hospital admissions injury data (state health departments)
 - Near miss/rescue data (emergency services)
- Analyses of this complete data set
 - Loss data
 - By peril and state
 - Temporal and spatial characteristics
 - Fatalities
 - Circumstances surrounding deaths
